

## THERMOLUMINESCENCE STUDY OF JAPANESE ANTARCTIC METEORITES XIV

K. Ninagawa<sup>1</sup>, A. Jyoike<sup>1</sup>, M. Kato<sup>1</sup>, N. Imae<sup>2</sup>, and H. Kojima<sup>2</sup><sup>1</sup>Okayama University of Science, <sup>2</sup>National Institute of Polar Research

Natural TL (thermoluminescence), the luminescence of a sample that has received no irradiation in the laboratory, reflects the thermal history of the meteorite in space and on Earth. Natural TL data thus provide insights into such topics as the orbits of meteoroids, the effects of shock heating, and the terrestrial history of meteorites. Induced TL, the response of a luminescent phosphor to a laboratory dose of radiation, reflects the mineralogy and structure of the phosphor, and provides valuable information on the metamorphic and thermal history of meteorites. The sensitivity of the induced TL is used to determine petrologic subtype of type 3 ordinary chondrites.

As reliable pairing approach, TL properties within large chondrites were analyzed, taking advantage of the fact that serial samples from these meteorites is known to be paired [1]. Then a set of TL pairing criteria: 1) the natural TL peak height ratios, LT/HT, should be within 20%; 2) that ratios of raw natural TL signal to induced TL signal should be within 50%; 3) the TL peak temperatures should be within 20°C and peak widths within 10°C was proposed. This set of TL pairing criteria is less restrictive than previously used [1].

We have measured TLs of 163 Yamato and 136 Asuka unequilibrated ordinary chondrites [1-8]. We measured TL of additional 30 Yamato chondrites (H3:14, L3:14, LL3:2) for determining 1) subtype and 2) pairing.

The TL data of them are listed in Table 1. The petrologic subtype was determined from their TL sensitivity. A chondrites, Y982240 (L3) were revealed to be primitive ordinary chondrites of petrologic subtype 3.3 as shown in Figure 1.

Natural and induced TL properties were also applied to find paired fragments. Above pairing criteria were applied to the 30 samples. However we could not find any TL potential paired fragments this time.

This work was carried out in part under the Visiting Researcher's Program of the Research Reactor Institute, Kyoto University.
